

8-Bit Up/Down Counter

SN54/74LS469A

74LS469A

Features/Benefits

- 8-bit up/down counter for microprogram-counter, DMA-controller and general-purpose counting applications
- 8 bits match byte boundaries
- Bus-structured pinout
- 24-pin SKINNYDIP® saves space
- Three-state outputs drive bus lines
- Low-current PNP inputs reduce loading
- Expandable in 8-bit increments

Description

The 'LS469A is an 8-bit synchronous up/down counter with parallel load and hold capability. Three function-select inputs (\overline{LD} , \overline{UD} , \overline{CBI}) provide one of four operations which occur synchronously on the rising edge of the clock (CK).

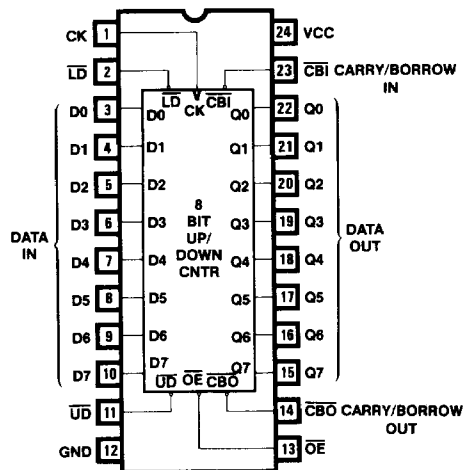

The LOAD operation loads the inputs ($D7$ - $D0$) into the output register ($Q7$ - $Q0$). The HOLD operation holds the previous value regardless of clock transitions. The INCREMENT operation adds one to the output register when the carry-in input is TRUE ($\overline{CBI} = \text{LOW}$), and the up/down control line (\overline{UD}) is LOW, otherwise the operation is a HOLD. The carry-out (\overline{CBO}) is TRUE ($\overline{CBO} = \text{LOW}$) when the output register ($Q7$ - $Q0$) is all HIGHS, otherwise FALSE ($\overline{CBO} = \text{HIGH}$). The DECREMENT operation subtracts one from the output register when the borrow-in input is TRUE ($\overline{CBI} = \text{LOW}$), and the up/down control line (\overline{UD}) is HIGH, otherwise the operation is a HOLD. The borrow-out (\overline{CBO}) is TRUE ($\overline{CBO} = \text{LOW}$) when the output register ($Q7$ - $Q0$) is all LOWs, otherwise FALSE ($\overline{CBO} = \text{HIGH}$).

The data output pins are enabled when \overline{OE} is LOW, and disabled (HI-Z) when \overline{OE} is HIGH. The output drivers will sink the 24 mA required for many bus-interface standards. Two or more 'LS469A 8-bit up/down counters may be cascaded to provide larger counters.

* When \overline{OE} is HIGH, the three-state outputs are disabled to the high-impedance state; however, sequential operation of the counter is not affected.

* No more than one output should be shorted at a time and duration of the short-circuit should not exceed one second.

** V_{IL} and V_{IH} parameters are, in effect, input conditions of D.C. and functional output tests are not directly tested. V_{IL} is specified at $\leq 0.8 \text{ V}$ and V_{IH} is specified at $\geq 2.0 \text{ V}$. † All typical values are at $V_{CC} = 5 \text{ V}$, $T_A = 25^\circ \text{C}$.

* f_{MAX} is derived from: $1/MAX [(t_{su} + t_h) \cdot t_w(\text{Low}) + t_w(\text{High}) \cdot t_{CLK}]$.

Test Load

* The "Test Point" is driven by the outputs under test, and observed by instrumentation

- Notes:
- t_{PD} is tested with switch S_1 closed. $C_L = 50 \text{ pF}$ and measured at 1.5 V output level.
 - t_{PZX} is measured at the 1.5 V output level with $C_L = 50 \text{ pF}$. S_1 is open for high impedance to "1" test, and closed for high impedance to "0" test.
 - t_{PXZ} is tested with $C_L = 5 \text{ pF}$. S_1 is open for "1" to high impedance test, measured at $V_{OH} = 0.5 \text{ V}$ output level; S_1 is closed for "0" to high impedance test measured at $V_{OL} = 0.5 \text{ V}$ output level.
